

ABSTRACT

The vehicle dashboard pertains to an onboard indicator with luminous needle. The indicator is mounted on a dashboard electronic card and the needle comprises an arm movable in rotation with a light source. The card is a source of energizing the light source. The light source comprises a support made of flexible material with a first part covered with a photophore substance and subjected to an electric voltage from the energizing source. The energizing source is linked electrically by a flexible electrical link which is formed by a second part of the insulating flexible support which serves as substrate for at least two conducting tracks.
